CLAIMS

Claims 1, 13 and 16 are amended.

Claims 4, 5, and 10 are canceled, without prejudice.

, 1. (Currently Amended) A method of preparing a plurality of data streams to allow seamless switching between said data streams by a switching device, wherein said switching device includes data stream buffering for an output data stream, said method comprising the

device includes data stream buffering for an output data stream, said method comprising the

steps of:

providing a plurality of data streams, said data streams including data which is divided into segments, wherein said segments include synchronized starting points and end

points on all of said plurality of data streams;

multiplexing said plurality of data streams for delivery to said switching device;

increasing a data rate of said plurality of data streams at a time before an end point of a segment by changing the multiplexing for said plurality of streams, wherein such changing of

multiplexing does not affect the contents of said plurality of data streams; and

providing gaps in said plurality of data streams between said end points and said starting

points.

2. (Original) The method of claim 1 further including the step of inserting trigger gap

indicators in said plurality of data streams proximate said end points.

3. (Original) The method of claim 1, wherein the step of increasing a data rate includes

increasing a bandwidth of said plurality of data streams.

4. (Canceled)

5. (Canceled)

2

Application No.: 09/735,983

Filed: December 13, 2000 Group Art Unit: 2611

6. (Original) The method of claim 1, wherein the step of increasing a data rate includes

compressing said data of said plurality of data streams.

7. (Original) The method of claim 1, wherein said plurality of data streams include

multimedia data streams.

8. (Original) The method of claim 7, wherein said plurality of data streams include

MPEG-2 encoded data streams.

9. (Original) The method of claim 8, wherein said plurality of data streams are

multiplexed in an MPEG-2 transport stream.

10. (Canceled)

11. (Original) The method of claim 7, wherein said plurality of data streams include AC3

encoded data streams.

12. (Original) The method of claim 1 further including the step of switching from one of

said plurality of data streams to another one of said plurality of data streams at an end point of a

segment by said switching device.

13. (Currently Amended) A system for preparing a plurality of data streams for

transmission by a multiplexed transport stream, said system to allow a receiver receiving said

transmitted data streams to seamlessly switch between said transmitted data streams; said system

comprising:

a content preparation component, coupled to a source of said plurality of data streams, to

encode content in said plurality of data streams with synchronized starting points and end points

common to all of said plurality of data streams;

3

Application No.: 09/735,983 Filed: December 13, 2000 Group Art Unit: 2611

a gap creation component, coupled to said content preparation component, said gap creation component to insert gaps in said plurality of data streams between said end points and said starting points;

a data rate control component, coupled to said gap creation component, to dynamically control data rates of said plurality of data streams by changing the multiplexing of said plurality of said plurality of data streams, wherein such changing of multiplexing does not affect the contents of said plurality of data streams.

- 14. (Original) The system of claim 13 further including:
- a trigger insertion component, coupled to said data rate control component, said trigger insertion component to insert trigger messages into said plurality of data streams.
- 15. (Original) The system of claim 13 wherein said plurality of data streams are transmitted using an MPEG-2 compliant transport stream, and said data rate control component controls data rates of said data streams in said transport stream.
- 16. (Original) A switching apparatus, to switch between a plurality of multiplexed data streams, wherein said data streams are prepared such that each data stream includes synchronized starting points and end points, with gaps between end points and starting points, and wherein the data rate of the said data streams is increased at a time before the synchronized end points, and the data rate for the said data streams is decreased at a time after the gaps, said increasing and decreasing of the data rates for said data streams is performed by changing the multiplexing of said data stream, wherein such changing of multiplexing does not affect the contents of said data streams, said switching component comprising:
 - a switch controller component;
 - a data stream receiver component, to receive the multiplexed data streams;
- a demultiplexer component, coupled to said data stream receiver component and said switch controller component, to select at least one of said multiplexed data streams in response to said switch controller component;

Application No.: 09/735,983

Filed: December 13, 2000

Group Art Unit: 2611

a buffer component, coupled to said a demultiplexer component, to receive said selected

at least one data stream; and to buffer said at least one data stream when said data rate for said

data stream is increased.

17. (Original) The switching apparatus of claim 16 wherein said switching apparatus is a

receiver for MPEG encoded media streams.

18. (Original) The switching apparatus of claim 16 wherein said switching apparatus is a

set top box.
